

Orkora Workflow

Audience: the WMXKED organizing team (Transformational Leadership 2026) and anyone setting up or running an event on Orkora.

This guide walks through the platform in the order an organizer actually uses it: registration, event setup and management, Story Mode, and Brand Home. The attendee (guest) workflow is covered last, so you can see the whole organizer side first and then follow what a guest experiences.

Two addresses are worth knowing up front:

- The organizer dashboard lives under [/dashboard](#).
- Every public event has a short code (WMXKED is one) and a shareable link at [orkora.events/e/WMXKED](#).

1. Registration

Registration is how a guest turns interest into a ticket. Orkora supports three paths into the same registrations list: the standard form, custom questions, and the new VIP express link.

The standard registration form

From the public event page a guest taps Register and lands on [orkora.events/e/WMXKED/register](#). They pick a ticket tier, enter attendee details (name, email, optional phone), answer any custom questions, and confirm. Free tickets are issued immediately and the ticket plus receipt are emailed. Paid tickets move to checkout first and are confirmed once payment clears.

Custom questions (per event)

WMXKED is a niche event, so it needs specifics at registration that a birthday party would not. You control those questions per event, not globally. In the event editor there is a "Registration form" section where you add questions (short text, long text, number, dropdown, multi-select, or a checkbox), mark each required or optional, and save. Those questions then appear on the register page for that one event, and the answers are stored against each registration.

For WMXKED specifically, the hardcoded intro heading ("A few questions" and "The organizer asked for these details") has been switched off using the per-event "Hide the intro heading" toggle, so the form shows only your own questions.

The tickets-remaining countdown

To nudge people who are still deciding, the public event page and the register page now show how many tickets are left. When any tier has a fixed quantity, the count of remaining seats appears as a small "N tickets left" marker on the public page and as an amber "Only N tickets remaining" banner on the register page. If everything is sold out it reads "This event is sold out". The count is the sum of

remaining seats across all tiers that have a set quantity; tiers with unlimited capacity are not counted, and if no tier has a limit the marker does not show at all.

The VIP express link

Some guests should not have to fill the long form. The VIP express link is a private, shareable link that lets a VIP register with name and email only, skipping your custom questions, and get their ticket instantly.

How to create it: open the event in the dashboard, find the "VIP express link" panel, and press Generate VIP link. Copy the link and send it to your VIP guests however you like (email, WhatsApp, a printed QR, and so on). The link looks like `orkora.events/e/WMXKED/vip?t=...` where the trailing part is a private token.

Notes on how it behaves:

- It is one shared link per event. Everyone you send it to uses the same link.
- Regenerate mints a fresh link and stops the old one from working, which is useful if a link was shared too widely. Remove link turns VIP registration off entirely.
- VIP guests are given a free ticket, so the event needs at least one free ticket tier for the link to work. If there is no free tier, the VIP page shows a clear message rather than charging anyone.
- Every VIP registration lands in the same registrations list as everyone else, tagged VIP, so you never have to reconcile a separate spreadsheet.

Where the registration data lives, and how to export it

All registrations for an event, from every path above, appear on the event's Registrations page: from the dashboard open the event, then Registrations (or go to `/dashboard/events/<event>/registrations`). That page lists each attendee with their tier, ticket count, status, when they registered, their answers to your custom questions, and a VIP tag where it applies. You can filter by status and search by name or email.

To export, press the "Export CSV" button on that Registrations page. The CSV includes name, email, status, a VIP column (Yes or No), tier, the registration timestamp, and one column per custom question. That file opens in Excel or Google Sheets.

There is also an org-wide registrations view under `/dashboard/registrations` ("Across every event") that lists registrations from all your events in one place, with filters by status and by event. It has its own "Export CSV" button that exports every registration matching the current filters (name, email, event, event code, status, tier, and the registration timestamp). Use the per-event export when you want the custom-question answers and the VIP column; use the org-wide export when you want everything across events in one file.

2. Event setup and management

This is the organizer's home base for a single event.

Creating an event: from `/dashboard/events` create a new event with its title, description, type, timezone, and start and end times.

Editing after publishing: you can edit a published event. Open it, and the "Event details" section lets you change the title, description, type, timezone, and the start and end dates and times. You do not have to unpublish to make a change. (An archived event is read only.)

The event editor is where you manage everything about the event in one place:

- Banner image, shown on the event card, the public page, the share preview, and the Story hero.
- Ticket tiers (Free, Standard, VIP, and so on), including group tickets that require a minimum number of people per order. Setting a quantity on a tier is what powers the tickets-remaining countdown described above.
- The registration form (custom questions) and the VIP express link, both covered in section 1.
- Discovery details (category and city) that help people find the event through search.
- Tracks, sessions, and speakers for the agenda.

Running the event: alongside the editor you have Story Mode, Registrations, Check-in, Analytics, Feedback, Discounts, Recordings, and Live. Publish and Unpublish control whether the public can see and register, and "Copy share link" gives you the orkora.events/e/WMXKED URL to send out.

3. Story Mode

Story Mode is the immersive, scroll-through version of the public event page. Where the classic page is a compact summary, Story Mode is built to sell the experience: a full hero, then a sequence of blocks (your narrative, speakers, agenda, tickets, and more) that a visitor scrolls through top to bottom.

You compose it from the event editor by opening Story Mode, arranging the blocks, and publishing when ready. Once published, visitors to orkora.events/e/WMXKED see the Story version. A floating "Get tickets" button follows the reader as they scroll and, when a tier has limited seats, shows the remaining count next to it (for example "Get tickets, 12 left"), so the urgency signal is present in Story Mode too. The Tickets block is always present in the flow, and the floating button is the always-accessible shortcut to it.

The event banner runs behind the Story hero as a background, so the image you set on the event carries through to the shareable Story page rather than disappearing.

4. Brand Home

Brand Home is your organization's public page: orkora.events/o/<your-slug>. It is the home that ties all your events together under one identity, so a guest who arrives from one event can find the rest.

You compose it from [/dashboard/branding](#) ("Compose your brand home"). There you set your brand colour, surface (background) colour, logo, and social links, and the public Brand Home page renders in that style. The Branding page also shows Brand Home views and where that traffic is coming from, so you can see how much the page is doing for you.

Because your brand colour and logo live here, they also flow into event pages, tickets, and share cards, which is what keeps everything looking like one brand rather than a set of unrelated links.

5. The attendee (guest) workflow

This is what a guest experiences, end to end. Everything above exists to make this path smooth.

1. The guest arrives at the event, usually from a link you shared: orkora.events/e/WMXKED . They see the event page (classic or Story Mode, depending on what you published), with the banner, the key details, the ticket options, and, when seats are limited, how many tickets remain.
2. They choose how to register: - Standard guests tap Register, pick a ticket tier, enter their details, answer your custom questions, and confirm. - VIP guests who received the VIP express link open it and enter only their name and email. They skip the ticket picker and the questions.
3. They confirm. A free or VIP ticket is issued immediately; a paid ticket goes through checkout first and is confirmed once payment succeeds.
4. They receive their ticket and receipt by email, and can open the ticket page to see the QR code used at check-in. They can also share a "I am going" card that carries your event branding.
5. On the day, your team runs Check-in from the dashboard, scanning the QR code (or entering the short ticket code by hand when no camera is available).

Behind all of this, whichever path the guest took, their registration appears on the event's Registrations page in real time, tagged VIP where it applies, ready to view, filter, search, and export to CSV.

Quick reference

- Public event page: orkora.events/e/WMXKED
- Register (standard): orkora.events/e/WMXKED/register
- VIP express link: orkora.events/e/WMXKED/vip?t=... (generated in the event editor)
- Brand Home (public): orkora.events/o/<your-slug>
- Event editor: [/dashboard/events/<event>](https://dashboard/events/<event>)
- Registrations and CSV export (per event): [/dashboard/events/<event>/registrations](https://dashboard/events/<event>/registrations)
- Registrations and CSV export (all events): [/dashboard/registrations](https://dashboard/registrations)
- Compose Brand Home: [/dashboard/branding](https://dashboard/branding)
